

Our physical modelling professionals have assisted clients around the world in the development of innovative solutions to complex hydraulic problems. Through an interactive and collaborative physical modelling approach, our clients are able to take part in the design process, which gives them confidence in the future performance of their projects. This upfront collaboration often results in significant construction and operation cost savings, as well as expedited project schedules. Our services include:

- Development, refinement, and verification of hydraulic designs
- Witness testing and demonstrations for project stakeholders
- Hydraulic performance rating
- Simulation of hydraulic structures and natural systems
- Experimental research and development of hydraulic devices and processes

We have one of the largest commercial physical hydraulic modelling operations in North America, with permanent facilities in both the US and Canada.
