

Our geoscience and engineering services provide fundamental information for a broad range of water resource-related applications, including: natural hazard assessment; land and natural resource development; aquatic habitat restoration; and, the planning, design, and implementation of water resource projects. These services include:

- River engineering
- River, stream, and wetland restoration
- Fish passage and habitat restoration
- Fluvial geomorphology studies
- Sedimentation analysis and modelling
- Water quality and thermal hydraulics modelling
- Riverine and coastal flood risk analysis
- Cold regions hydraulic engineering
- Monitoring and surveying services
- Hydraulic modelling and analysis

Our strengths include the restoration and enhancement of channels that have been degraded by human activity or traumatic natural events.
